

SALADIN-CLASS

Entered Service: 2236. *Saladin*-class starships were retired from service after 2286.

Overview: Officially classified as light frigates, the *Saladin*-class served as scouts and destroyers in Starfleet. In addition to accompanying larger vessels, they were used for short term exploratory missions. *Saladin*-class ships often charted sectors, scanning planets at long range to evaluate their resources and potential for life, before returning to a nearby Starbase or station. Based on the initial sensor sweeps by *Saladin* ships, dedicated exploratory vessels would be dispatched, such as *Einstein* and *Pioneer*-class starships, allowing those ships to maximize their exploration while minimizing their time spent in deep space. When the *Constitution*-class entered service the usefulness of the *Saladin*-class as preliminary exploratory vessels began to wane, as the newer ships were able to easily spend years at a time at the fringes of known space. Instead of scouting, vessels were relegated to mapping systems and cataloging star systems.

Capabilities: The *Saladin*-class was designed to be a companion to the *Einstein*-class, and later a less-expensive companion to *Pioneer* and *Constitution*-class vessels. It had 15 decks, spread out over its saucer section and the neck connecting the primary hull to the warp nacelle. The typical crew complement of a *Saladin*-class ship was 150 to 200, but a crew as small as 100 could easily operate the ship. The single nacelle and small reactor meant the class lacked engine power and higher warp velocities, but this limited energy profile made the ship less easily detected by sensor scans, enabling the ship to move undetected. During the 2230s and 2240s, the class was expected to perform scientific missions, and was equipped with expansive laboratory facilities in addition to its detailed long-range sensors. After the 2260s, as the *Constitution*-class took over the exploratory role in Starfleet, many *Saladin*-class starships were given an extensive refit, replacing some of their scientific facilities with photon torpedo launchers and additional shielding, allowing them to better function as maneuverable destroyers. As a large number of *Saladin* vessels had been constructed, many were available for military missions, operating in small patrol groups, often working in tandem with the slightly smaller *Perseus*-class escorts.

HERMES-CLASS SCOUT STARSHIPS

A sub-class of the *Saladin* is the *Hermes*-class scout. The two vessels look identical, with the *Hermes* being a modification of the *Saladin*-class.

Hermes-class ships were equipped with fewer armaments, having not received the upgrade of photon torpedo launchers in the 2260s. Instead, their long range sensors and computers were upgraded in the refit. Because the class retained the sensitive sensor equipment of a scientific vessel, *Hermes*-class ships became the eyes and ears of Starfleet.

Hermes-class vessels often patrolled the Neutral Zone with the Romulans and the border of Klingon space. Several vessels of this class were employed by Section 31 for less orthodox scouting.
